- **Institution:** VIT Bhopal University
- **Date :** 25/11/2025

❖ The *Skincare & Haircare Advisor* is a Python-based recommendation system designed to provide a guidance users in choosing suitable products, ingredients, and home remedies based on their skin or hair type.

❖ The project uses a structured , in-program database that organizes products, ingredients they contain , their benefits , the effects they have on skin and their price

- ❖ When the user selects a skin type or hair type, the program filters the database and displays the best-suited products along with their usage

- ❖ The system aims to simplify skincare and haircare routines, especially for beginners who feel overwhelmed by the vast number of cosmetic options available.

Introduction

Choosing the correct skincare or haircare product has become quite a task nowadays due to the huge variety available in the market. Whereas Wrong choices can lead to harsh impact on skin and hair .
Thus , we have created a Python project that attempts to solve this problem by offering a simple **recommendation tool**. Based on user inputs such as gender , age , skintype , budget .

Based on previous inputs , this program suggests:

- Suitable skincare products in budget
- Best haircare products
- Home remedies
- Ingredient explanations
- Product descriptions

Also , This project very well demonstrates how Python dictionaries can function as a structured database and thus help to create highly useful applications.

Problem Statement

In todays time , skincare has become a basic need . Having said that there are many people who struggle to understand which product is suitable for their skin or hair type.
They sytill rely on trial-and-error method , or patch test method or random recommendations, which often worsens their skin/hair conditions.
Thus, this creates a need for a simple, educational tool that provides **clear, type-based recommendations** without needing advanced dermatology knowledge.

Objectives of this project

- To create a Python program that helps people find appropriate products based on skin and hair typeand budget
- To help beginners understand which ingredients/products suit their needs .

- To practice and demonstrate Python fundamentals (data structures, functions, filtering, loops) .

- To create easily extendable code for future expansion

Basic Algorithm :-

- User runs the program
- User selects skin type or hair concern
- Program filters the product database
- Suitable products + descriptions are displayed
- Home remedies and ingredient info are shown

Results

Thus we can say that , The Skincare & Haircare Advisor successfully helps in :-

- Preventing confusion during product selection.
- Providing proper guidance to users who wish to begin their skincare journey
- Educating users on active ingredients that are suitable for their skin and their impact on their skin
- Functioning as a beginner-friendly Python project.

Limitations

This program whereas has its own limitations , which include problems such as

- It doesn't have a GUI (only terminal-based)
- It has a small and manually defined Database
- It doesn't have any real time online product fetching .
- It doesn't have any dermatologist-certified recommendations

Conclusion

This project thus demonstrates how Python can be used to create simple recommendation systems that also have a wide use in today's world . These recommendation systems play a very important role in providing appropriate guidance to people in every field .

The Skincare & Haircare Advisor helps users avoid unsuitable products and educates them on product benefits. It is easy to expand, making it a strong foundation for larger cosmetic-analysis tools or AI-based beauty applications.
